

Hands-On: React Routing

In this lab, you will create a simple React app that uses React Router to navigate between different pages.

Step 1: Create a new React app

Create a new React app by running the following command in your terminal:

```
npx create-react-app my-app  
cd my-app
```

Step 2: Install React Router

Install React Router by running the following command in your terminal:

```
npm install react-router-dom
```

Step 3: Create the components

Create two new components called ``Home`` and ``About``. Add the following code to the ``Home.js`` file:

```
import React from 'react';  
  
function Home() {  
  return (  
    <div>  
      <h1>Home</h1>  
      <p>Welcome to the home page!</p>  
    </div>  
  );  
}  
  
export default Home;
```

Add the following code to the ``About.js`` file:

```
import React from 'react';  
  
function About() {  
  return (  
    <div>  
      <h1>About</h1>  
      <p>This is the about page!</p>  
    </div>  
  );  
}  
  
export default About;
```

Step 4: Create the routes

Create a new file called ``App.js`` in the ``src`` directory and add the following code:

```

import React from 'react';
import { BrowserRouter as Router, Route, Link } from 'react-router-dom';
import Home from './Home';
import About from './About';

function App() {
  return (
    <Router>
      <div>
        <nav>
          <ul>
            <li>
              <Link to="/">Home</Link>
            </li>
            <li>
              <Link to="/about">About</Link>
            </li>
          </ul>
        </nav>

        <Route exact path="/" component={Home} />
        <Route path="/about" component={About} />
      </div>
    </Router>
  );
}

export default App;

```

This component uses the **BrowserRouter** component from React Router to define the routes for the app. The **Route** components define the paths and the components to be rendered for each path. The **Link** components are used to navigate between the different pages.

Step 5: Test the app

Run the app using **npm start** and test the app by navigating between the different pages using the links in the navigation bar.

Congratulations! You have successfully created a React app that uses React Router for routing.
