

Hands-On: Styling in React - Inline Styling, CSS Stylesheets, and CSS Modules

Approach 1: Inline Styling

Inline styling is when you apply styles directly to an element using the **style** attribute. Here's an example of using inline styling in React:

```
import React from 'react';

function App() {
  const headerStyle = {
    backgroundColor: 'blue',
    color: 'white',
    padding: '10px',
    textAlign: 'center'
  }

  return (
    <div>
      <h1 style={headerStyle}>Welcome to My App</h1>
      <p style={{ fontWeight: 'bold' }}>This is some bold text</p>
    </div>
  );
}
```

In this example, we define a `headerStyle` object with the styles we want to apply to the `h1` element. We then pass this object to the `style` prop on the `h1` element. We also apply some inline styles directly to the `p` element using an object literal.

Approach 2: CSS Stylesheets

Another approach to styling in React is to use CSS stylesheets. You can create a CSS file and import it into your component.

```
import React from 'react';
import './styles.css';

function App() {
  return (
    <div>
      <h1 className="header">Welcome to My App</h1>
      <p className="bold">This is some bold text</p>
    </div>
  );
}
```

In this example, we import a CSS file called `styles.css` and apply the `header` and `bold` classes to the `h1` and `p` elements, respectively.

Approach 3: CSS Modules

CSS Modules are a way to locally scope CSS classes in React. You can create a CSS file with a unique name and import it into your component using the ``import styles from './styles.module.css'`` syntax.

```
import React from 'react';
import styles from './styles.module.css';
```

```
function App() {
  return (
    <div>
      <h1 className={styles.header}>Welcome to My App</h1>
      <p className={styles.bold}>This is some bold text</p>
    </div>
  );
}
```

In this example, we import a CSS module called ``styles.module.css`` and use the ``header`` and ``bold`` classes from it to apply styles to the ``h1`` and ``p`` elements, respectively.

Conclusion

In this lab, you learned about different approaches to styling in React, including inline styling, CSS stylesheets, and CSS modules. With these tools, you can create visually appealing and dynamic user interfaces in your React applications.
